

RELATIONAL MODEL CONCEPTS

- A relation schema, denoted $R(A_1, A_2, \dots, A_n)$, is made up of a name R and a list of attributes A_1, A_2, \dots, A_n .
- A domain of an attribute is a set of valid values for the attribute.
- A relation of the relation schema $R(A_1, A_2, \dots, A_n)$, denoted by $r(R)$, is a set of n -tuples $r = \{t_1, t_2, \dots, t_m\}$, where $t_i = \langle v_{i1}, v_{i2}, \dots, v_{in} \rangle$ and $v_{ij} \in \text{Dom}(A_i)$.
- The degree of a relation is the number of the attributes n in its relation schema.

RELATIONAL CONSTRAINTS AND RELATIONAL DATABASE SCHEMAS

- A superkey of the relation schema is a subset of the attributes SK , such that for any two tuples $t_1, t_2 \in r(R)$ $t_1[SK] \neq t_2[SK]$. In other words, the value of a superkey uniquely identifies the tuple.
- A key K of the relation schema R is a superkey, such that any proper subset of K is not a superkey. In other words, a key is a minimal superkey.
- The primary key is a key that is chosen to be the primary key.
- A relational database schema is a set of relation schemas $S = \{R_1, R_2, \dots, R_n\}$ and a set of integrity constraints.

INTEGRITY CONSTRAINTS

- Domain constraint: $V_i \in \text{Dom}(A_i)$.
- Key constraint: key must be unique.
- Entity integrity constraint: no primary key value can be null.
- Referential integrity constraint: a tuple in one relation that refers to another relation must refer to an existing tuple in that relation, e.g. A STUDENT who Takes COURSE must take an existing course.

ER-TO-RELATIONAL MAPPING

Step 1. For each entity E,

- 1) Create a relation R_E that includes all the simple attributes and simple component attributes of a composite attribute;
- 2) Choose one of the key attributes as primary key.

Step 2. For each weak entity W with owner entity E,

- 1) Create a relation R_W that includes all the simple attributes and simple component attributes of a composite attribute;
- 2) Include as foreign key attributes in R_W the primary key of R_E that corresponds to E;
- 3) The primary key of R_W is the combination of the primary key of R_E and the partial key of W.

4

ER-TO-RELATIONAL MAPPING

Step 3. For binary 1:1 relationship with participating entities E1 and E2,

- 1) Choose one of the relation, say R_{E1} , and include as foreign key in R_{E1} the primary key of R_{E2} ;
- 2) Include the simple attributes and simple component attributes of the relationship as attributes of R_{E1} .

Step 4. For binary 1:N relationship with participating entities E1 and E2 (N-side),

- 1) Include as foreign key in R_{E2} the primary key of R_{E1} ;
- 2) Include the simple attributes and simple component attributes of the relationship as attributes of R_{E2} .

5

ER-TO-RELATIONAL MAPPING

Step 5. For binary M:N relationship with participating entities E1 and E2,

- 1) Create a relation R that includes all the simple attributes and simple component attributes of the relationship;
- 2) Include as foreign key attributes in R the primary key of R_{E1} and R_{E2} ;
- 3) The primary key of R is the combination of the primary key of R_{E1} and that of R_{E2} .

6

ER-TO-RELATIONAL MAPPING

Step 6. For each N-ary relationship with participating entities E_1, E_2, \dots, E_n ,

- 1) Create a relation R that includes all the simple attributes and simple component attributes of the relationship;
- 2) Include as foreign key attributes in R the primary key of R_{E_1}, R_{E_2}, \dots , and R_{E_n} ;
- 3) The primary key of R is the combination of the primary key of R_{E_1} , that of R_{E_2} , ..., and that of R_{E_n} .

7

ER-TO-RELATIONAL MAPPING

Step 7. For each multi-valued attribute A of E ,

- 1) Create a relation R_A that includes A as an attribute;
- 2) Include as foreign key in R_A the primary key of R_E ;
- 3) The primary key of R_A is the combination of A and the primary key of R_E .
