

## HASHING - APPROACHING DIRECT ACCESS BASED ON THE KEY VALUE

- A simple hashing scheme

Name	ASCII Code for first two chars		Product	Home Address
BALL	66	65	$66*65=4290$	290
LOWELL	76	79	$76*79=6004$	004
TREE	84	82	$84*82=6888$	888

Problems:

- Many names have the same first two characters => collisions
- Some combinations of two characters never occur in any name => skew distribution

## HASHING

- A better hashing scheme:

1) Fix the length and represent the key in numerical form

1 2 3 4 5 6 7 8 9 10 11 12  
LOWELL = L O W E L L  
76 79 87 69 76 76 32 32 32 32 32 32

2) Fold and add

76 79 | 87 69 | 76 76 | 32 32 | 32 32 | 32 32 |  
76 79 + 87 69 + 76 76 + 32 32 + 32 32 + 32 32

# HASHING

Problem: What if overflow occurs?

Solution: Take prime 19937, do modulo 19937 after each addition.

$7679 + 8769 \Rightarrow 16448 \% 19937 \Rightarrow 16448$

$16448 + 7676 \Rightarrow 24124 \% 19937 \Rightarrow 4187$

$4187 + 3232 \Rightarrow 7419 \% 19937 \Rightarrow 7419$

$7419 + 3232 \Rightarrow 10651 \% 19937 \Rightarrow 10651$

$10651 + 3232 \Rightarrow 13883 \% 19937 \Rightarrow 13883$

3) Do modulo by the size of the addressing space (e.g. 101)

$a = 13883 \% 101$

$= 46$

# HASHING

```
int Hash ( char Key[12], int MaxAddress )
{
    int sum = 0;
    for ( int j=0, j<12, j+=2 )
        sum = (sum + 100*Key[j] + key[j+1]) % 19937;
    return sum % MaxAddress;
}
```

## RESOLVING COLLISIONS

- Progressive overflow: if collisions occur, check the subsequent position for space.

York has the home address of 6 which is occupied.  
Thus York is stored in the first empty space after 6, namely 9.

Dr. Wang, Cal State Fullerton

5

## RESOLVING COLLISIONS

Problem: What if the end of the array is reached?

Solution: Do  $(i + 1) \% M$ , where  $M$  is the size of the array, that is look at the array as a circle.

Dr. Wang, Cal State Fullerton

6

## HASHING WITH PROGRESSIVE OVERFLOW

On Search:

If key is found in the home address, OK.

Otherwise sequentially scan the subsequent positions until:

- 1) Key is found, or
- 2) an empty space is encountered, or
- 3) come back to the home address.

The last two cases indicate that the key is not there.

7

## SEARCH LENGTH

- Example:

Key	Home Address		
Adams	20	20	Adams
Bates	21	21	Bates
Cole	21	22	Cole
Dean	22	23	Dean
Evans	20	24	Evans
Flint	21	25	Flint
			⋮

Key	Adams	Bates	Cole	Dean	Evans	Flint
#of Accesses	1	1	2	2	5	5

On the average  $(1 + 1 + 2 + 2 + 5 + 5)/6 = 2.67$  accesses.

3/7/2018

Dr. Wang, Cal State Fullerton

8

## HASHING WITH PROGRESSIVE OVERFLOW

- On deletion – Tombstones: Marked the record as deleted.
- Implications of tombstones for search and insertion:
  - 1) Search should continue when tombstones are encountered.
  - 2) Insertion should do a search to make sure the key does not exist and then come back to insert at the first tombstone or empty space.

9

## ALTERNATIVE SOLUTIONS TO COLLISIONS

- 1) Double hashing: when collisions occur, do  $(i + c)\%M$  instead of  $(i + 1)\%M$ .  
e.g. when  $c = 7$ .

Key	Home Address
Adams	20
Bates	21
Cole	21
Dean	22
Evans	20
Flint	21

20	Adams	27	Evans
21	Bates	28	Cole
22	Dean		
23			
24			
25		35	Flint

What is the number of comparisons on average?

3/7/2018

Dr. Wang, Cal State Fullerton

10

## ALTERNATIVE SOLUTIONS TO COLLISIONS

- 2) Chained progressive overflow: Overflow records are stored as linked lists in the addresses starting from M on, i.e. M, M+1, M+2, .... e.g. when M = 101.

Key	Home Address				
Adams	20	20	Adams	102	101
Bates	21	21	Bates	101	102
Cole	21	22	Dean	-1	103
Dean	22	23			
Evans	20	24			
Flint	21	25			

What is the number of comparisons on average?

3/7/2018

Dr. Wang, Cal State Fullerton

11

## ALTERNATIVE SOLUTIONS TO COLLISIONS

- 3) Scatter tables

Key	Home Address				
Adams	20	20	0	Adams	4
Bates	21	21	1	Bates	2
Cole	21	22	3	Cole	5
Dean	22	23	-1	Dean	-1
Evans	20	24	-1	Evans	-1
Flint	21	25	-1	Flint	-1

What is the number of comparisons on average?
